Hi! We're Digitsofpi and Kineto, two friends devoted to coding the games, experiments, and anything else that sparks our interest!

We mainly code games on Unity, but formerly worked on Khan Academy. We still check and post there sometimes!

We started coding together on Khan Academy in 2021. Digits made his first game earlier that year, and shortly after their partnership, Kineto made his. Throughout the year, we conceptualized and partly developed two large-scale games: Shop Run, and Aero 2000. Although neither would be completed, it served as an important stepping stool by teaching us important concepts of game development. At the end of the year, we realize something crucial. Kineto's Khan Academy account was attached to a school he was leaving. If he didn't back up his projects, his account along with programs would end up getting deleted. We merged khan academy accounts, expecting it to be a temporary fix. It made collaboration so much easier, and we share an account to this day.

We entered and won a contest in 2025, releasing 4 high-quality games in just weeks. We rebuilt Aero 2000 from scratch, 4 years after touching it last.

nearly half of Aero 2000's development time was devoted to it's backgrounds. Khan Academy doesn't have a native way to load images, so we built a converter from scratch, bought this domain, and posted DK Converter. A week later, Khan Academy banned all images, despite them having been around for over a decade. It was done in the name of safety, but it is debated whether or not the change was effective.

After having remade an old game idea, we decided to finally finish our most ambitious project yet: DASH Parkour.

DASH Parkour is a 2d platformer where Dash had to beat bosses to become the Parkour Champion. When we looked back at our old code, we realized how messy it was and we would need to rebuild it from the ground up. So, we scrapped the old version that had 3 years of work in it, and built DASH Parkour from the ground up in just a couple months.

Because of the image ban, we decided to escape Khan Academy's safety constraints and move to unity. We leaned c#, released DASH Parkour 1.1 with multiplayer, rebuilt this website, and are currently working on our first unity game. Check out our updates to see how it is going!
